MATHEMATICAL PRELIMINARIES

UNIT-1 FINITE STATE AUTOMATA

①

INTRODUCTION TO FORMAL PROOF:

Proof:- A Proof is a convincing argument that some statement is true.

* Deductive Proof:- (Direct Proof):

- Sequence of statements whose truth leads us from some initial statements called hypothesis to a conclusion statement.

Ex: Prove that if $x \geq 4$ then $2^x \geq x^2$.

Proof: when $x = 4$ then

$$2^x = 2^4 = 16$$

$$x^2 = 4^2 = 16$$

$$\Rightarrow 2^x = x^2.$$

As x grows larger than 4,
 2^x doubles each time x
increase of one.

\therefore Each time x increases

above 4, 2^x grows more
than x^2 .

Hence Proved.

* Proof by Contrapositive:-

- The contrapositive of a statement if H then C is if not C then not H.
To prove a statement it is enough to prove contrapositive.

Ex: Prove that for any integer i, j

and n if $i+j=n$ then either $i \leq \sqrt{n}$
or $j \leq \sqrt{n}$.

Proof: - If $i+j=n$ then either $i \leq \sqrt{n}$
or $j \leq \sqrt{n}$.

or given is,
 $i > \sqrt{n}$ and $j > \sqrt{n}$ then $i+j \neq n$

let us prove, contrapositive statement

$i > \sqrt{n} - ①$, $j > \sqrt{n} - ②$

$\text{①} \Rightarrow i > \sqrt{n}$ multiply both sides by j

$\text{②} \Rightarrow i+j > \sqrt{n} + j$ — ③

$\sqrt{n} \times j > \sqrt{n} \times \sqrt{n}$, $\sqrt{n} \times j > n$ — ④
from ③ & ④, $i+j > \sqrt{n} + j > n$

$i+j \Rightarrow n$, $i+j \neq n$.
The contrapositive of given statement is true. Hence the given statement also true.

INDUCTIVE PROOFS:

MATHEMATICAL INDUCTION:-

$P(n)$ is a statement involving an integer n , to show $P(n)$ is true for all $k \geq n_0$. This proof needs,

1. $P(n_0)$ is true
2. If $P(k)$ is true, then
 $P(k+1)$ is true for $k \geq n_0$.

Ex: S.T $1+2+3+\dots+n = \frac{n(n+1)}{2}$.

Step 1: Basis:

$$\text{If } n=1 \Rightarrow \frac{1(1+1)}{2} = \frac{1(1+1)}{2} = 1$$

Hence the proof.

Step 2: Induction:

Assumption is,

$$1+2+3+\dots+k = \frac{k(k+1)}{2}$$

To prove, $1+2+3+\dots+(k+1) = \frac{(k+1)(k+2)}{2}$

$$\text{L.H.S} + 2 + 3 + \dots + k + (k+1)$$

$$= \frac{k(k+1)}{2} + (k+1) = \frac{(k+1)(k+2)}{2}$$

Hence the proof. Ans

CENTRAL CONCEPT OF AUTOMATA

THEORY

FINITE AUTOMATA :-

A Finite Automata is formally denoted by five tuple, $(Q, \Sigma, \delta, q_0, F)$ where

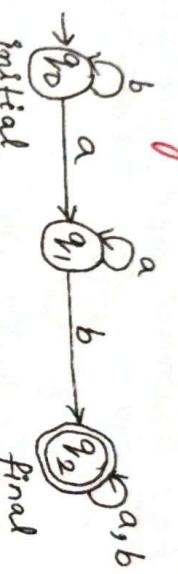

Q is the set of states

Σ is the input alphabet

δ is the transition function

q_0 is initial state

F is final set of states.

Types of finite Automata :-

1. Deterministic Finite Automata (DFA)

2. Non-Deterministic Finite Automata (NFA)

DFA

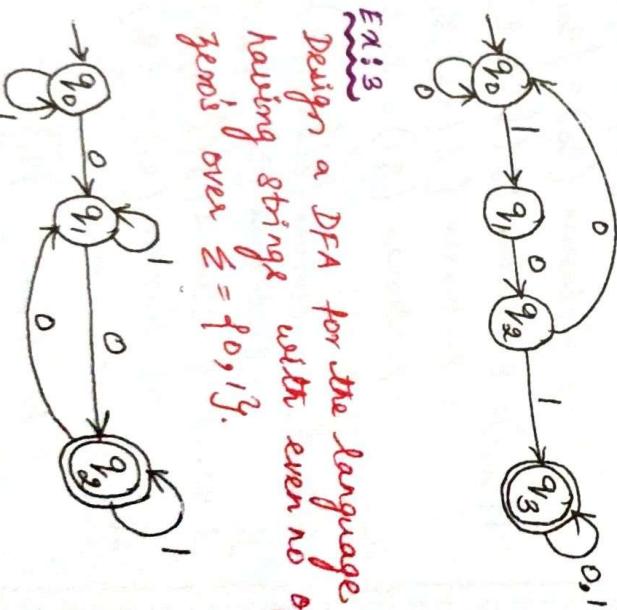

NFA

- From each state for each input symbol there is exactly one transition.
- No ϵ -transitions

Ex: 2
Design a DFA for the language having strings with 101 as substring over $\Sigma = \{a, b\}$.

Ex: 3
Design a DFA for the language having strings with even no of zeros over $\Sigma = \{0, 1\}$.

where δ is,
 $\delta(q_0, a) = q_1, \delta(q_0, b) = q_2$
 $\delta(q_1, a) = q_1, \delta(q_1, b) = q_2$
 $\delta(q_2, a) = q_2, \delta(q_2, b) = q_1$

DFA problems

Ex: 1
Design a DFA for the language having strings with ab as a substring over $\Sigma = \{a, b\}$.

Ex: 2
Design a DFA to accept strings that start with A and end with B over $\Sigma = \{a, b\}$ also write formula def. of DFA.

Ex: 3
Design a DFA to accept strings starting with A and ending with B over $\Sigma = \{a, b\}$. write formula def. of DFA. check whether the string abab is accepted or not!

NFA problems

Ex: 1
Design a NFA to accept strings starting with A and end with B over $\Sigma = \{a, b\}$ also write formula def. of NFA.

Ex: 2
Design a NFA to accept strings starting with A and end with B over $\Sigma = \{a, b\}$ also write formula def. of NFA.

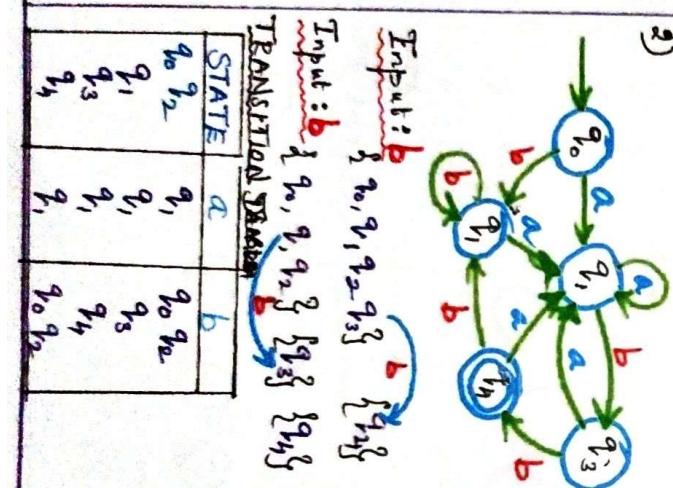

Ex: 3
Design a NFA for the language having strings with even no of zeros over $\Sigma = \{0, 1\}$.

MINIMIZATION OF DFA

States	a	b
q_0, q_3	q_1, q_5	q_0, q_6
q_1, q_5	q_0, q_6	q_2, q_4
q_2, q_4	q_3	q_3
q_3	q_4	q_0, q_6
q_4	q_5	q_1, q_5
q_5	q_6	q_2, q_4
q_6	q_7	q_0, q_6

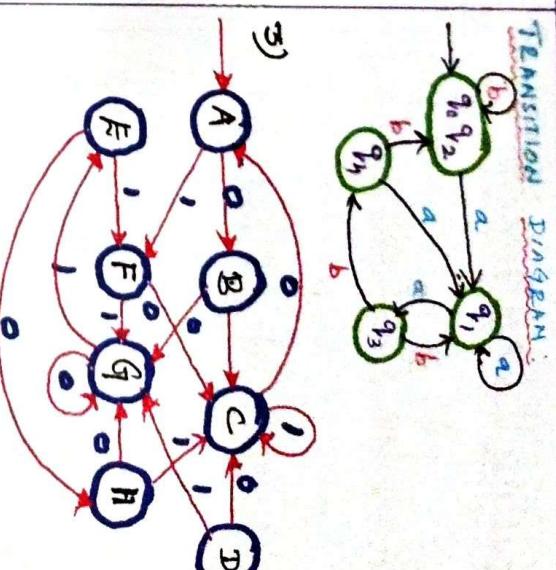

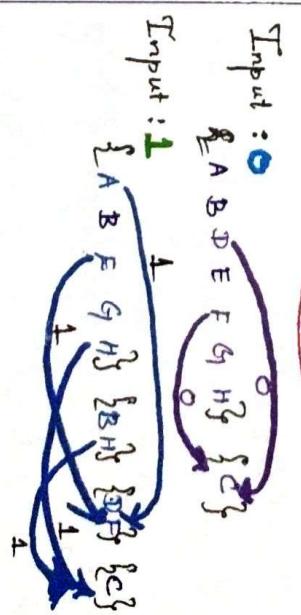

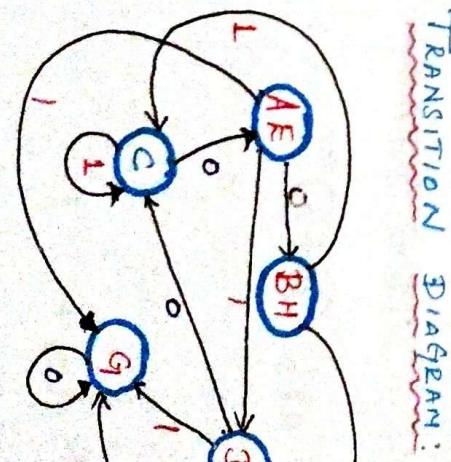

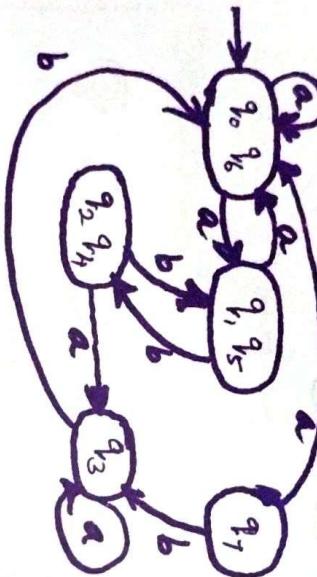

Input : a

$\{q_0, q_3\} \xrightarrow{a} \{q_1, q_5\}$ $\{q_1, q_5\} \xrightarrow{a} \{q_3\}$
 $\{q_0, q_3\} \xrightarrow{b} \{q_2, q_4\}$ $\{q_2, q_4\} \xrightarrow{b} \{q_3\}$

TRANSITION	a	b
$q_0, q_6 \xrightarrow{a} q_1, q_5$	$q_1, q_5 \xrightarrow{b} q_0, q_6$	$q_0, q_6 \xrightarrow{a} q_2, q_4$
$q_1, q_5 \xrightarrow{a} q_0, q_6$	$q_0, q_6 \xrightarrow{b} q_2, q_4$	$q_2, q_4 \xrightarrow{b} q_1, q_5$
$q_2, q_4 \xrightarrow{a} q_3$	$q_3 \xrightarrow{b} q_1, q_5$	
$q_3 \xrightarrow{a} q_4$	$q_4 \xrightarrow{b} q_0, q_6$	

TRANSITION DIAGRAM :

PUMPING LEMMA FOR REGULAR SET:

Pumping Lemma:

Let $L \rightarrow$ Regular language
 $n \rightarrow$ Constant

such that for every string in 'W' in 'L'
 Such that $|W| \geq n$

We can break W into three
 $W = xyz$

* $y \neq \epsilon$
 $|xy| \leq n$

* $xyz \in L \forall k \geq 0$

Note: Repeating y any no of times

Dekking Y keeps the resulting string in
 the same language.

Problem Based on Pumping lemma:

Prove that the set

$L = \{0^{i^2} \mid i \geq 1\}$

which consist of all strings of 0's whose length is perfect square is not regular

Assume the given language L is a regular

Let us take the sample string $w = 0^{n^2}$

where n is the constant of pumping lemma

By pumping lemma:
 We can write, $0^{n^2} = xy^kz$

Where

1) $y \neq \epsilon$

2) $|xy| \leq n$

3) $xy^kz \in L \forall k \geq 0$

By pumping lemma,
 $xy^kz \in L$

$|xy^kz|$ Must be a perfect square

Let us find $|xy^kz|$

$$|x^2y^2z| = |xy^2z| + |y|$$

$$\leq n^2 + n$$

$$\therefore |xy| \leq n \text{ and}$$

$$y \neq \epsilon$$

$$|xy^2z| > n^2 \rightarrow \text{①}$$

$$|xy^2z| \leq (n+1)^2 \rightarrow \text{②}$$

$$\text{From ① and ②}$$

$|xy^2z|$ lies properly b/w two perfect square and hence $|xy^2z|$ is not a perfect square.

Contradiction that difference

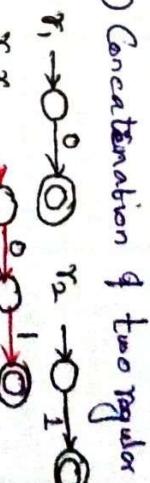

Given language is not regular.

CLOSURE PROPERTIES OF REGULAR LANGUAGES

MUTUAL

1) Union of two regular language is Regular.

$$L(m) = L(m_1) \cup L(m_2)$$

2) Concatenation of two regular language is Regular.

3) Intersection of two regular language is Regular.
 $L \cap M$ is also regular

4) The difference of two regular language is Regular.
 $L - M$ is Regular. $L - M = L \cap \overline{M}$ Regular.

5) The Complement of Regular language is Regular.
 $\overline{L} = \Sigma - L$

6) The reversal of a regular language is Regular.
 $L = 001 \xrightarrow{\text{0}} \text{0} \xrightarrow{\text{0}} \text{0} \xrightarrow{\text{1}} \overline{L} = 100 \xrightarrow{\text{0}} \text{0} \xrightarrow{\text{0}} \text{0}$

7) Closure & Regular is Regular.
 $w = a^*$

8) The Homomorphism of Regular Language is Regular.
 $w = a \rightarrow \text{0} \xrightarrow{\text{0}} \text{0} \xrightarrow{\text{1}} \text{b}$ Hence $h(w) = a, h(c) = b$
 $\rightarrow \text{0} \xrightarrow{\text{a}} \text{0} \xrightarrow{\text{b}} \text{b}$ Hence $h(c)$ also Regular.

9) The Inverse homomorphism of a regular language is Regular.

SIMPLIFICATION OF CFG:

* ELIMINATION OF ϵ -PRODUCTION:-

Ex: 1 Eliminate ϵ -productions from the grammar.

$$\begin{aligned} S &\rightarrow AB \\ A &\rightarrow aAA / \epsilon \\ B &\rightarrow bBB / \epsilon. \end{aligned}$$

Sol: S, A, B are nullable.

$$\begin{aligned} S &\rightarrow AB / B/A \\ A &\rightarrow aAA / aA/a \\ B &\rightarrow bBB / bB/b. \end{aligned}$$

Ex: 2 Eliminate ϵ -productions from the grammar.

$$S \rightarrow X Y Z, \quad X \rightarrow \alpha X / \epsilon, \quad Y \rightarrow \beta Y / \epsilon.$$

Sol: X, Y are nullable

$$S \rightarrow XYZ / YZ / XZ / Z$$

$$X \rightarrow \alpha X / \alpha$$

$$Y \rightarrow \beta Y / \beta.$$

* ELIMINATION OF UNIT PRODUCTION:-

Ex: 1 Consider the grammar,

$$E \rightarrow T / E + T$$

$$\begin{aligned} T &\rightarrow F / T * F \\ F &\rightarrow I / (CE) \\ I &\rightarrow a/b / I_a / I_b / I_0 / I_1. \end{aligned}$$

$$\begin{aligned} S &\rightarrow bX \\ A &\rightarrow bSX \\ X &\rightarrow ad \end{aligned}$$

Step 1: After removing non-gener

-ating symbols
B,

Step 2: After removing non-readable symbol A,

$$S \rightarrow bX$$

$$X \rightarrow ad$$

* ELIMINATION OF USELESS SYMBOLS:-

Ex: Consider the grammar

$$\begin{aligned} S &\rightarrow aB / bX \\ A &\rightarrow \beta ad / bSX / a \\ B &\rightarrow \alpha SB / bBX \\ X &\rightarrow SBD / aBX / ad. \end{aligned}$$

Sol: After removing non-gener

GREIBACH NORMAL FORM (GNF)

Lemma:1 $NT \rightarrow$ one terminal, any number of $NTs.$

$$\left. \begin{array}{l} S_1 \\ S_2 \end{array} \right\} \begin{array}{l} A \rightarrow \alpha_1, B \alpha_2 \\ B \rightarrow \beta_1 / \beta_2 / \dots / \beta_r \end{array} \} \quad \begin{array}{l} \text{then} \\ A \rightarrow \alpha_1, \beta_1 \alpha_2 / \alpha_1, \beta_2 \alpha_2 / \\ \alpha_1, \beta_3 \alpha_2 / \alpha_1, \beta_4 \alpha_2 / \dots \\ \vdots \\ \alpha_1, \beta_r \alpha_2. \end{array}$$

Lemma:2

$$\left. \begin{array}{l} S_1 \\ S_2 \end{array} \right\} \begin{array}{l} A \rightarrow A \alpha_1 / A \alpha_2 \dots \\ A \rightarrow \beta_1 / \beta_2 / \dots / \beta_r \end{array} \} \quad \begin{array}{l} \text{then} \\ A \rightarrow \beta_1 \\ A \rightarrow \beta_2 \\ \vdots \\ A \rightarrow \beta_r. \end{array}$$

$$\begin{array}{l} B \rightarrow \alpha'_1 \\ B \rightarrow \alpha'_2 \\ B \rightarrow \alpha'_3 \\ B \rightarrow \alpha'_4. \end{array}$$

Now,

$$A_3 \rightarrow A_3 \underbrace{A_1 A_3 A_2} / \underbrace{b A_3 A_2} / \underbrace{a}_{\beta_1} \quad | \quad \underbrace{\beta_2}_{\beta_1}$$

$$A \rightarrow A \alpha'_1 \quad | \quad A_3 \rightarrow A_3 A_1, A_3 A_2$$

$$A \rightarrow \beta_1 / \beta_2 \quad | \quad A_3 \rightarrow b A_3 A_2 / a$$

$$\begin{array}{l} A \rightarrow \beta_1, A \rightarrow \beta_2 \\ A \rightarrow \beta_1 B, A \rightarrow \beta_2 B. \end{array} \quad | \quad \begin{array}{l} A_3 \rightarrow b A_3 A_2, A_3 \rightarrow a \\ A_3 \rightarrow b A_3 A_2 B, A_3 \rightarrow a b \end{array}$$

$$\begin{array}{l} B \rightarrow \alpha'_1 \\ B \rightarrow \alpha'_2 \\ B \rightarrow \alpha'_3 \\ B \rightarrow \alpha'_4. \end{array} \quad | \quad \begin{array}{l} B \rightarrow A_1 A_3 A_2 \\ B \rightarrow A_1 A_3 A_2 B. \end{array}$$

then we can apply lemma now,
we get,

Ex: convert to GNF for the grammars $G_1 = \{A_1, A_2, A_3\}, \{a, b\}, P, A_1\}$ where P consist of the following

$$\begin{array}{l} A_1 \rightarrow A_2 A_3 \\ A_2 \rightarrow A_3 A_1 / b \\ A_3 \rightarrow A_1 A_2 / a. \end{array}$$

Sol:- let us consider, $A_3 \rightarrow A_3 A_1 A_3 A_2$
 $A_3 \rightarrow b A_3 A_2 / a$

we can apply lemma 2,

$$\begin{array}{l} A_1 \rightarrow b A_3 A_2 B A, A_3 / a B A, A_3 / b A_3 A_2 A_1 A_3 / a A_1 A_3 / b A_3 \\ A_2 \rightarrow b A_3 A_2 B A_1 / a B A_1 / b A_3 A_2 A_1 / a A_1 / b \\ A_3 \rightarrow b A_3 A_2 / b A_3 A_2 B / a B / a \\ B \rightarrow b A_3 A_2 B A, A_3 A_3 A_2 / a B A, A_3 A_3 A_2 / \\ b A_3 A_2 A_1 A_3 A_3 A_2 / a A_1 A_3 A_3 A_2 / b A_3 A_3 A_2 / \\ b A_3 A_2 B A, A_3 A_3 A_2 B / a B A, A_3 A_3 A_2 B / \\ b A_3 A_2 A_1 A_3 A_3 A_2 B / a A_1 A_3 A_3 A_2 B / b A_3 A_3 A_2 B. \end{array}$$

APPLICATIONS OF CONTEXT-FREE GRAMMARS

- * Used in Parsing (Syntax Analysis)
- * Natural Language Processing.
- * Compiler Design.

Human Activities Recognition.

CLOSURE PROPERTIES OF CONTEXT FREE LANGUAGES

- * Union of two CFL's is context free
- * Concatenation of two CFL's is context free.
- * Closure of a CFL is context free.
- * Intersection of two CFL's is not context free.
- * Intersection of a CFL and a regular language is context free.
- * Complement of a CFL is not context free.
- * Substitution of a CFL is context free.
- * Homomorphism of a CFL is context free.
- * Inverse Homomorphism of a CFL is context free.

Languages

Ex:1 Show that the language $L = \{0^n 1^n 2^n \mid n \geq 1\}$ is not context free.

Sol:-

Assume that the given language is context free,

let us take the string $z = 0^n 1^n 2^n$

where n is constant of pumping lemma.

$z = u v w x y$, such that,
 i) $v \neq \epsilon$, ii) $|vwx| \leq n$

iii) $uv^nwx^y \in L$, $\forall n \geq 0$.

The string vwx cannot have all 3 symbols, 0's, 1's and 2's because $|vwx| \leq n$

case i) vwx has no 2's, $\therefore vwx$ consists of only 0's & 1's. put $i=0$,

uv^nwx^y , we get uwy ,

string uwy will have n no's of 2's but fewer than n 0's & 1's.

$\therefore uwy \notin L$

which is a contradiction

∴ The given language is not context free.

- i) $v \neq \epsilon$
- ii) $|vwx| \leq n$
- iii) $uv^nwx^y \in L \quad \forall n \geq 0$.

PROBLEMS BASED ON PUMPING LEMMA:-

Ques:-

Show that the language $L = \{0^i 1^j 2^k \mid i \geq 1, j \geq 1, k \geq 1\}$, is not context free.

Assume the given language is context free, let us take the string $z = 0^n 1^n 2^n$, where n is constant,

By pumping lemma,
 $z = u v w x y$, such that
 i) $v \neq \epsilon$,
 ii) $|vwx| \leq n$
 iii) $uv^nwx^y \in L, \forall n \geq 0$.

The string vwx cannot involve all the symbols 0's 1's & 2's.
 It can have atmost two symbols case i)
 vwx consists of only symbol

e.g. Assume vwx consists of 0's. put $i=0$ in uv^nwx^y , the string uwy will have n no's of 1's, 2's & 3's. But fewer than n 0's.

The number of 0's and 2's do not match

$\therefore uwy \notin L$ which is a contradiction

∴ The given language is not context free.

PUSH DOWN AUTOMATA

PDA Definition:

$$PDA : M = (Q, \Sigma, \Gamma, S, q_0, z_0, F)$$

Design 9 PDA for the language $L = \{ 0^n 1^n / n \geq 1 \}$ by final state.

Solution:

Nature of the Problem:
Number of 0's are equal to Number of 1's

Execution procedure:

- q_0 - Accepting only one zero
- q_1 - Accepting more zeros till 1
- q_2 - Used to pop the stack if symbol Σ
- q_3 - Accepting / Final state

Moves AND INSTANTANEOUS DESCRIPTIONS

$$\begin{aligned} \text{To design moves: } S(q_0, 0, z_0) &= (q_1, 0z_0) \\ S(q_1, 0, 0) &= (q_1, \epsilon) \\ S(q_1, 1, 0) &= (q_2, \epsilon) \\ S(q_2, 1, 0) &= (q_2, \epsilon) \\ S(q_2, \epsilon, z_0) &= (q_3, z_0) \end{aligned}$$

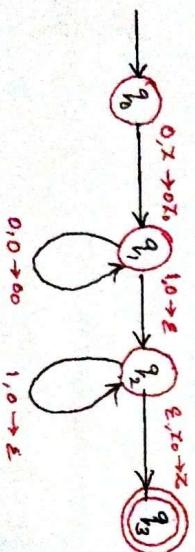

Then $PDA \cdot M = \{ Q, \Sigma, \Gamma, S, q_0, z_0, q_3 \}$

$$Q = \{ q_0, q_1, q_2, q_3 \}$$

$$\Sigma = \{ 0, 1 \}$$

$$\Gamma = \{ z_0, \epsilon \}$$

q_0 is initial state
 q_0 is start symbol
 q_3 is final state

THE LANGUAGE OF A PDA

Design 9 PDA for the language $L = \{ a^m b^m c^m d^m \mid m, n \geq 0 \}$ by empty stack. And also design it for $m, n \geq 1$ by empty stack.

If $m, n \geq 0$.

$$d, a \rightarrow \epsilon$$

$$c, b \rightarrow \epsilon$$

$$d, a \rightarrow \epsilon$$

$$b, z_0 \rightarrow b z_0$$

$$c, z_0 \rightarrow c z_0$$

$$a, z_0 \rightarrow a z_0$$

$$b, a \rightarrow b a$$

$$c, b \rightarrow \epsilon$$

$$d, a \rightarrow \epsilon$$

$$a, a \rightarrow aa$$

$$ε, z_0 \rightarrow ε$$

$$b, z_0 \rightarrow bb$$

$$c, b \rightarrow \epsilon$$

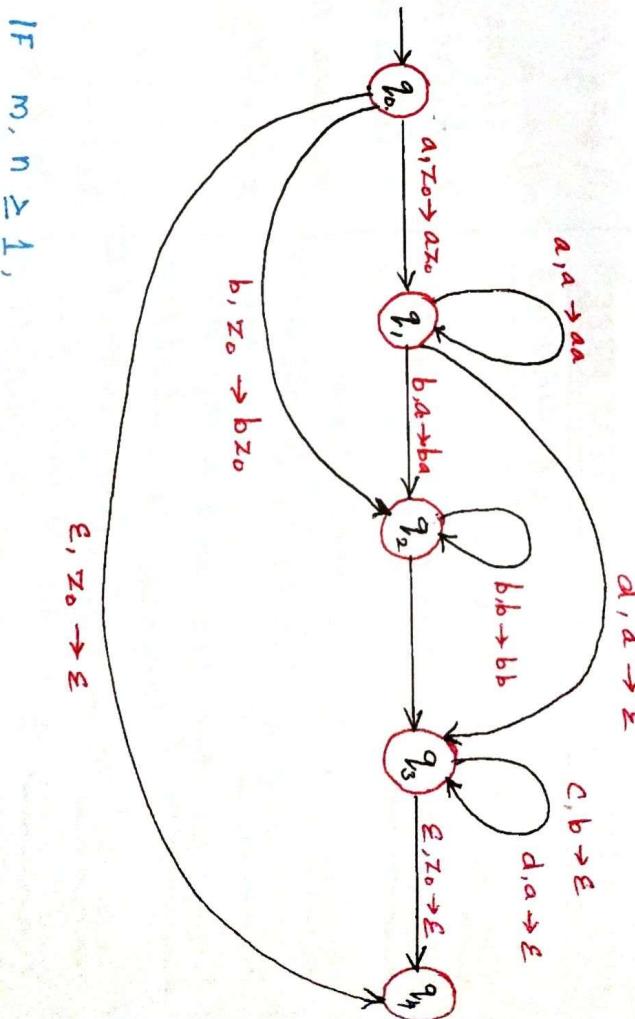

$$d, a \rightarrow \epsilon$$

$$a, z_0 \rightarrow az_0$$

$$b, a \rightarrow ba$$

$$c, b \rightarrow \epsilon$$

$$d, a \rightarrow \epsilon$$

Equivalence of PDA's AND CFG's

PDA \rightarrow CFG

Let $N = \{q_0, q_1, q_0, q_1, x, z_0\}, S = q_0$

Where,

δ is given by.

$$\delta(q_0, 0, z_0) = (q_0, xz_0)$$

$$\delta(q_0, 0, x) = (q_0, xx)$$

$$\delta(q_1, 1, x) = (q_1, \epsilon)$$

$$\delta(q_1, \epsilon, x) = (q_1, \epsilon)$$

$$\delta(q_1, \epsilon, z_0) = (q_1, \epsilon)$$

Construct CFG G generating N(u)

S productions are,

$$P_1 : S \rightarrow [q_0, z_0, q_0]$$

$$P_2 : S \rightarrow [q_0, z_0, q_1]$$

$\delta(q_0, 0, z_0) = (q_0, xz_0)$

S productions are :

$$P_3 : [q_0, z_0, q_0] \rightarrow o [q_0, x, q_0] [q_0, z_0, q_0]$$

$$P_4 : [q_0, z_0, q_0] \rightarrow o [q_0, x, q_1] [q_1, z_0, q_0]$$

$$P_5 : [q_0, z_0, q_1] \rightarrow o [q_0, x, q_0] [q_0, z_0, q_1]$$

$$P_6 : [q_0, z_0, q_1] \rightarrow o [q_0, x, q_1] [q_1, z_0, q_1]$$

Let us take,

$$\delta(q_0, 0, x) = (q_0, xx)$$

S productions are

$$\begin{aligned} P_7 &: [q_0, x, q_0] \rightarrow o [q_0, x, q_0] [q_0, x, q_0] \\ P_8 &: [q_0, x, q_0] \rightarrow o [q_0, x, q_0] [q_1, x, q_0] \\ P_9 &: [q_0, x, q_1] \rightarrow o [q_0, x, q_0] [q_0, x, q_1] \end{aligned}$$

$$P_{10} : [q_0, x, q_1] \rightarrow o [q_0, x, q_1] [q_1, x, q_1]$$

$$P_{11} : [q_0, x, q_1] \rightarrow \epsilon \quad \delta(q_0, 1, x) = (q_1, \epsilon) \\ P_{12} : [q_1, z_0, q_1] \rightarrow \epsilon \quad \text{for } \delta(q_1, \epsilon, z_0) = (q_1, \epsilon) \\ P_{13} : [q_1, x, q_1] \rightarrow \epsilon \quad \text{for } \delta(q_1, \epsilon, x) = (q_1, \epsilon)$$

$$\text{PDA is given by,} \\ M = \{ \Sigma^3, \{+, *, a, b, c, \}, o, \}, \\ \Sigma^3, \{+, *, a, b, \{, \}, o, \}, \\ \{q_0, q_1, \epsilon\}$$

Construct the given Expression

$$E \rightarrow T \mid E * E \mid E + E \mid (E) \\ T \rightarrow a \mid b \mid T_a \mid T_b \mid T_o \mid T_i$$

CFG \rightarrow PDA

$p_1, p_2, p_{10}, p_{12}, p_{13}, p_{14}$ are the only productions that can able to produce the terminals. So we have to delete the other productions

$$(i) \quad \delta(q_1, \epsilon, E) = \{(q_1, a), (q_1, b), (q_1, T_a), (q_1, T_b), (q_1, T_o), (q_1, T_i)\}$$

$$(ii) \quad \delta(q_1, a, a) = (q_1, \epsilon) \quad \delta(q_1, c, c) = (q_1, \epsilon) \\ \delta(q_1, E * E) = (q_1, \epsilon), (q_1, E + E)$$

$$(iii) \quad \delta(q_1, b, b) = (q_1, \epsilon) \quad \delta(q_1, \gamma) = (q_1, \epsilon) \\ \delta(q_1, \epsilon, o) = (q_1, \epsilon) \quad \delta(q_1, +, +) = (q_1, \epsilon) \\ \delta(q_1, 1, 1) = (q_1, \epsilon) \quad \delta(q_1, *, *) = (q_1, \epsilon)$$

Programming Techniques for

Turing Machine

- Storage in Finite control!
- Multiple Track
- Checking off symbols
- Subroutine.

$$\boxed{11111 - 11 = 111}$$

Storage in Finite Control!

TM has finite control!

It stores the following information

- Current state
- Current symbol

$$S(2_0, a) = (2_1, b, R)$$

↓ ↓ ↓
 current state input modified symbol
 movement direction

So TM can recognise the

language 0^n , n

2. Multiple Tracks

Using multiple track, we can

Perform Subtraction

#	1	1	1	1	1	#
B	B	B	B	1	1	B
B	1	1	1	B	B	B

Turing Machine [TM]

Design TM to recognize

PDA and TM

Finite Automata

- It recognizes Regular language
- The tape is of finite length
- One direction movement

Checking off symbols

* TM can recognize any type of string using off symbols.
* Using off symbols, it decides the direction left or right.

→ TM can recognize the

$$L = \{ww\bar{w}\}$$

$$w = aba \in \{a, b\}^*$$

Transition configuration

1. $S(2_0, 0) = (2_1, X, R)$

2. $S(2_1, 0) = (2_1, 0, R)$

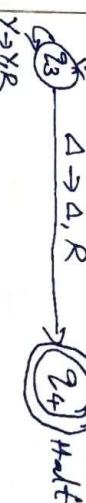

3. $S(2_1, 1) = (2_2, Y, L)$

4. $S(2_2, 0) = (2_2, 0, L)$

5. $S(2_2, X) = (2_0, X, R)$

6. $S(2_3, Y) = (2_3, Y, R)$

7. $S(2_3, A) = (2_4, A, R)$

PDA

- It will recognize CFC, RL

- Stack memory used

- Push & Pop operation

TM

- Push & Pop operation

Language

- It recognizes All

Language

- Infinite length tape is used.

- Head can move in both directions.

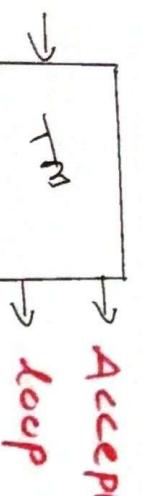

Undecidability

14

Recursive Enumerable Language

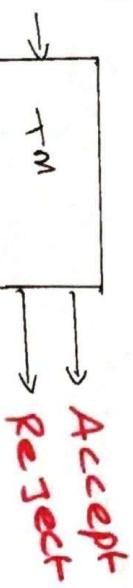

we can prove that

Halt-TM is undecidable.

- * R.E language can be accepted or recognized by TM.
- * TM will not enter into rejecting state, it means TM can loop forever.

Recursive language

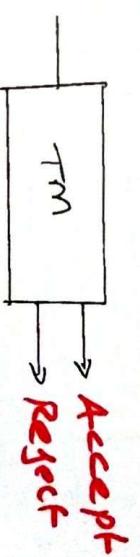

The recursive language can be decided by TM, which means it will enter into accept state or reject state for the string & language.

Undecidable Problem

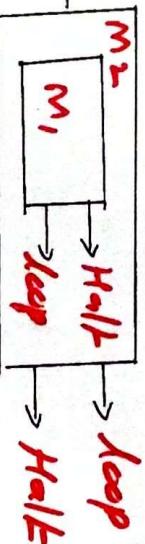

Halt-TM is undecidable.

Basic Idea

If Halt-TM is decidable
↓ Decidable language is also turing acceptable

But Halt-TM Problem is undecidable.

[If M₁ halt then M₂ will loop
If M₁ loop then M₂ will Halt]

* It is contradiction
* So Halt-TM is undecidable.

* Prove that the diagonalization language Ld is not Recursively Enumerable Ld.

creation of Diagonalization lang.

0	1	1	0
0	1	0	0
1	1	1	0
1	0	1	1

$$\text{Original value} = \overline{0111} \\ = \overline{1000}$$

[If w is in Ld then TM will accept 'w'
But By the definition of Ld
w \notin Ld]

* Thus Ld is not recursively Enumerable language.

Recursive & Recursively Enumerable Languages

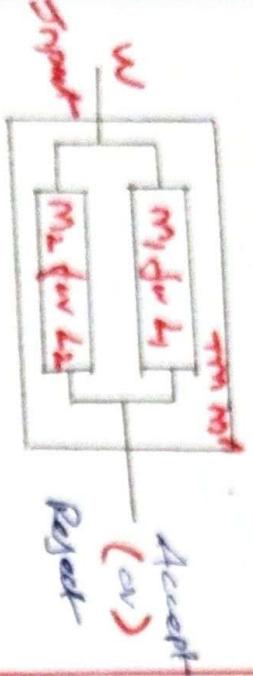

Enumerable Language

* Theorem

If L_1 & L_2 are recursive.

Then $L_1 \cap L_2$ also

language is recursive enumerable.

[If $w \in L_1 \cap L_2$ then .

M_1 Halt or M_2 Halt

If $w \notin L_1 \cap L_2$ then

M_1 & M_2 will not Halt]

[If $w \in L_1$ & $w \in L_2$ then

M_1 Halt or M_2 Halt

If $w \notin L_1 \cap L_2$]

M_1 & M_2 are recursive

Hence L_1 & L_2 are recursive

then $L_1 \cap L_2$ also recursive

language.

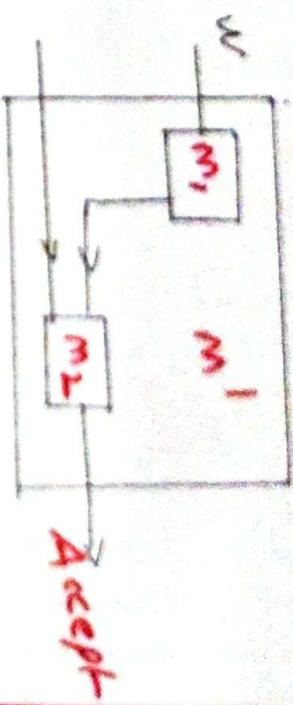

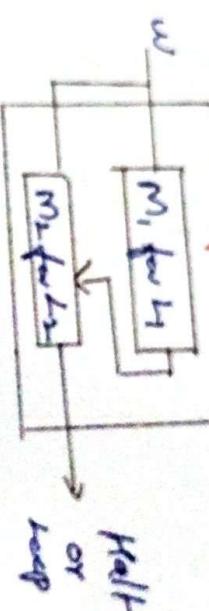

We conclude that m' behaves for the language

behaves for the language of $L_1 \cap L_2$.

Theorem

If two language L_1 and L_2 are recursively enumerable then their intersection $L_1 \cap L_2$ also recursive enumerable.

M for $L_1 \cap L_2$

1. [If $w \in m'_1 \cap m'_2$ $w \notin m$]

2. [If m'_1 accept w then

m'_1 accept the language of m'_2]

3. [If m'_2 accept w then

By the condition of 1,2,3 we can not decide code for m'_1 .

This proves that the property of Recursively Enumerable is undecidable.

Rice's Theorem

Every non trivial property of Recursively Enumerable language is undecidable.

UNDECIDABILITY-3

Enumerating Binary Code

Obtain the code for $\langle M, 1011 \rangle$ where

$$M = \langle q_2, q_2, q_3 q, q_0 q_3, q_0, 1, Bq, \delta,$$

$q_1, B, q_2 q_3 \rangle$ has the moves

$$\delta(q_1, 1) = (q_2, 0, R)$$

$$\delta(q_3, 0) = (q_1, 1, R)$$

$$\delta(q_3, 1) = (q_2, 0, R)$$

$$\delta(q_2, B) = (q_3, 1, L)$$

Consider the following replacements

$$\begin{array}{ll} q_1 \text{ by one zero} & \text{left by one zero} \\ q_2 \text{ by two zeros} & \text{right by 2 zeros} \\ q_3 \text{ by 3 zeros} & \end{array}$$

directions

stats

$$\begin{array}{l} 0 \text{ by one zero} \\ 1 \text{ by 2 zeros} \\ B \text{ by 3 zeros} \end{array}$$

code for $\langle M, 1011 \rangle$ is

$$\begin{array}{ll} 111 \quad \underline{0100100010100} & \text{Code-1} \\ & \underline{\text{Code-2}} \\ 11 \quad \underline{000100010001000100010} & \text{Code-3} \\ & \underline{\text{Code-4}} \end{array}$$

w

Post's Correspondence Problem

let $\Sigma = \{0, 1\}$

let A and B be strings. Find the instance of Post's correspondence problem

i	W _i	X _i
1	1	111
2	10111	10
3	10	0

Let $M = A$,

$$i_1 = 2, i_2 = 1, i_3 = 1, i_4 = 3$$

Take this combination 2113

By concatenating strings in this series

$$w_2 w_1 w_3 = x_2 x_1 x_3$$

$$\underline{10111} \underline{11} \underline{10} = \underline{10} \underline{111} \underline{111} \underline{0}$$

\therefore Instance of PCP is 2113

For another instance 2113 2113 of a PCP has a solution.

Tape symbols
